

Project Folder Structure

An example project folder structure, represented as text.

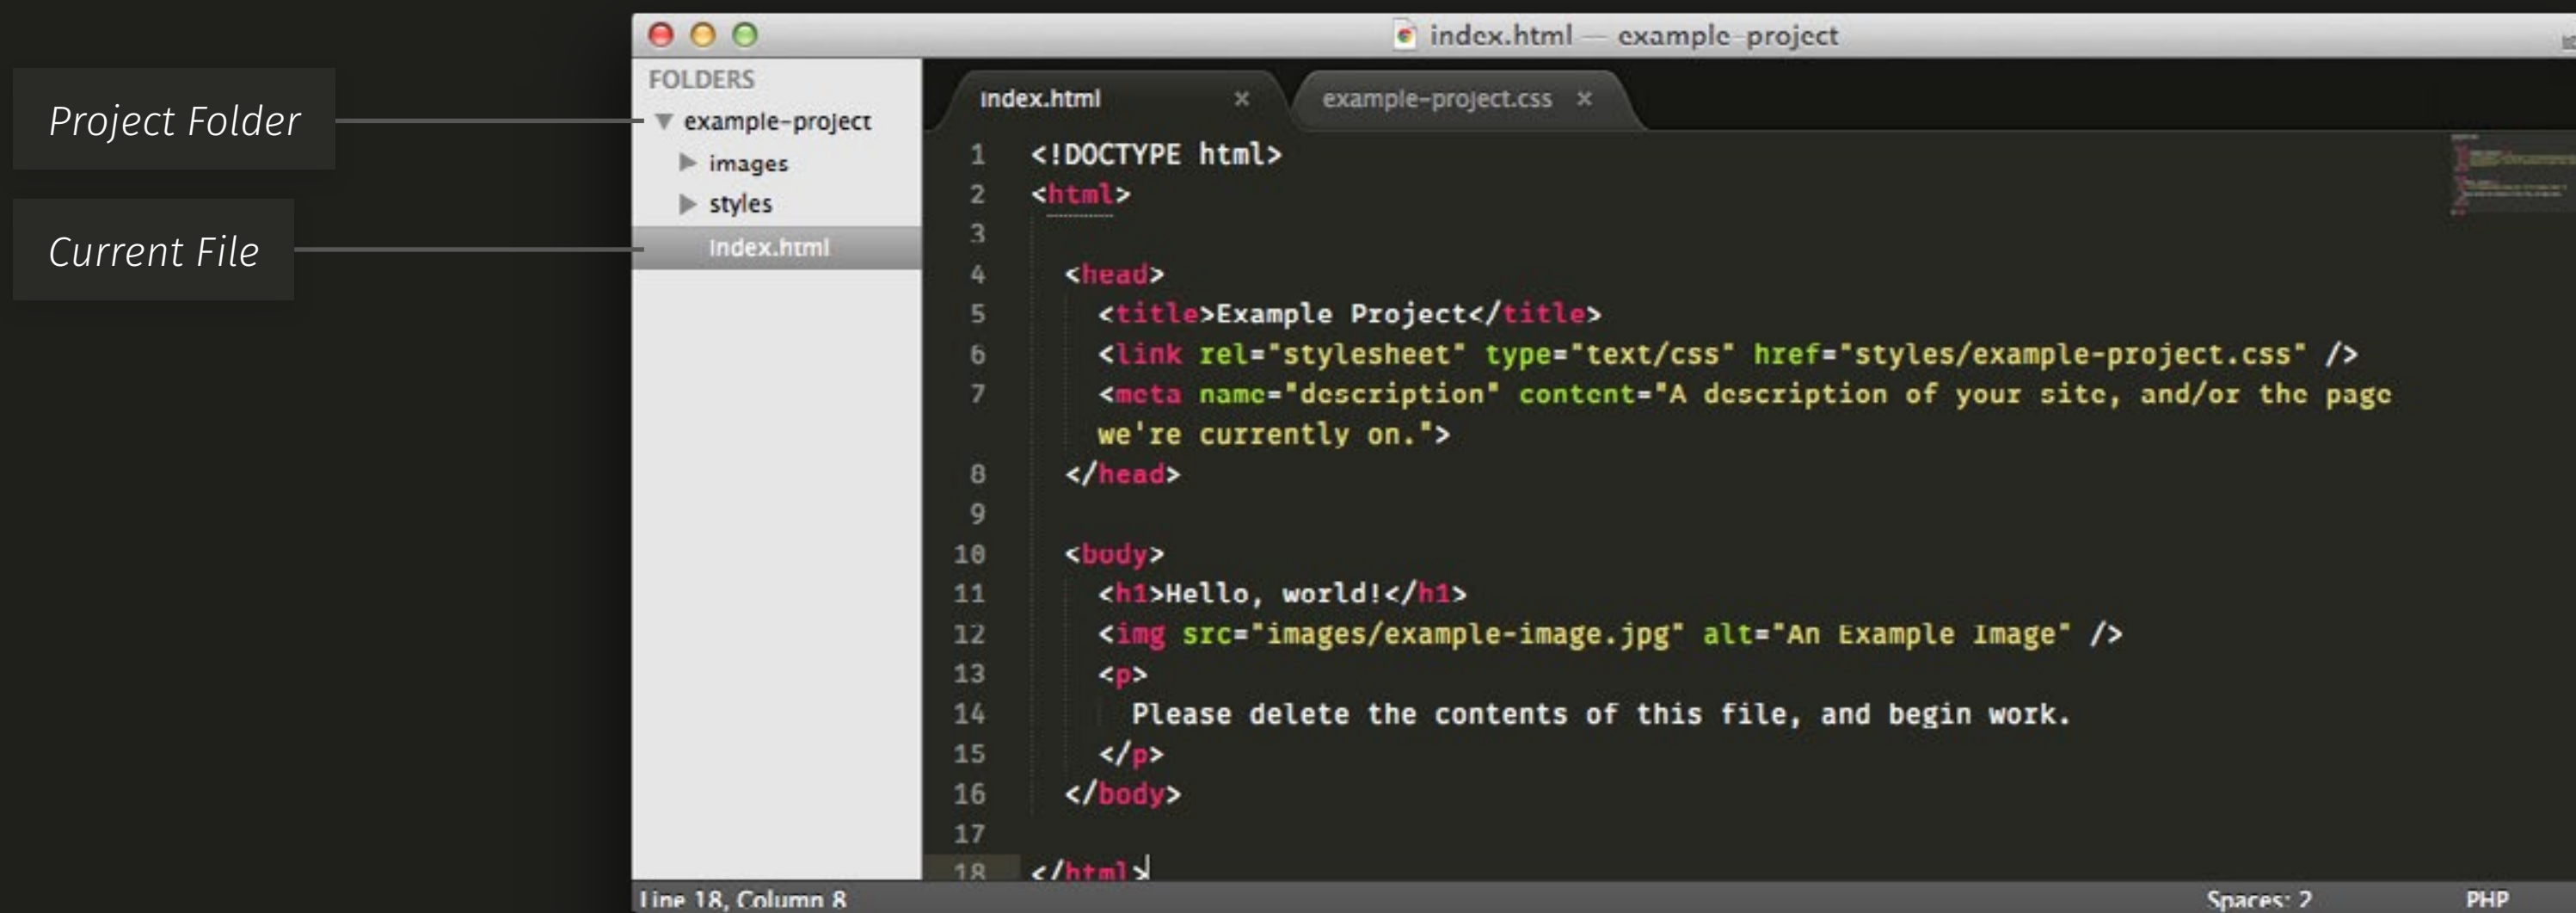

When we're just starting out with a new site, this is a fairly flexible folder structure.

We always include an `index.html` in the main folder. Move assets and stylesheets into *sub-folders* so they don't clutter the main one when you start adding more pages.

*Opening files in Chrome is as easy as **Command+O** or **File → Open***

Browse to your project folder, and select `index.html`.

The example-project folder open in Sublime Text

To open your project in Sublime Text, drag the folder to the icon in the dock, or use Command+O and navigate to the folder.

Don't select any particular files, or only those will be opened. The project folder itself must be selected.

```
<link rel="stylesheet" type="text/css" href="styles/example-stylesheet.css" />
```

The `link` tag, associating a stylesheet to an HTML document.

The `link` tag is the easiest way to include a stylesheet in your HTML document. This tag always appears in the `<head></head>` of the document.

Notice that the `link` tag's `href` attribute includes `styles/`. This directs the browser to look in the “styles” folder of your project for `example-stylesheet.css` rather than in the main folder.

```
<!DOCTYPE html>
<html>
  <head>
    <title>Example Project</title>
    <link rel="stylesheet" type="text/css" href="styles/example-stylesheet.css" />
  </head>
  <body>
    <h1>Hello, world!</h1>
  </body>
</html>
```

The link tag in the context of the document head.

Most of your HTML files will probably start out looking something like this. Be sure to rename files appropriately, and update the links!
